Project Summary

The North Tenement 5MW solar park in Swansea was completed as a BOT (Build-Operate-Transfer) project. M Renewables acquired the project rights, built and put the project in operation and then successfully finalized an agreement for the sale of the plant (as part of a group of four operating solar PV projects in the UK, with a total capacity approx. 18 MW), to a leading solar industry investor.

The scope of works included works inside the fence and the grid interconnection line at 33kV and with 800m length. The development and financing of solar PV and energy storage projects represents an important new aspect of the company's global solution portfolio, effectively building on the strong track record as a preferred EPC contractor for major solar IPP's.
